

(a) one atom lost

truncated stabilizer anticommutes

$$\Pr[m_a = 0]$$

(b) both atoms lost

empty trap cannot be bright

$$\text{observed } \Pr[m_a = 0] = (1 - \eta)\frac{1}{2} + \eta(1 - \epsilon)$$

$$\Rightarrow \hat{\eta} = \frac{\Pr[m_a = 0] - \frac{1}{2}}{\frac{1}{2} - \epsilon}$$
